

Clinical staff members need a quick and easy way to enter incident reports.

Managers and administrators need immediate access to incident report information.

Risk managers and quality improvement professionals need the tools to monitor and track all incidents and the responses and follow-up to those incidents.

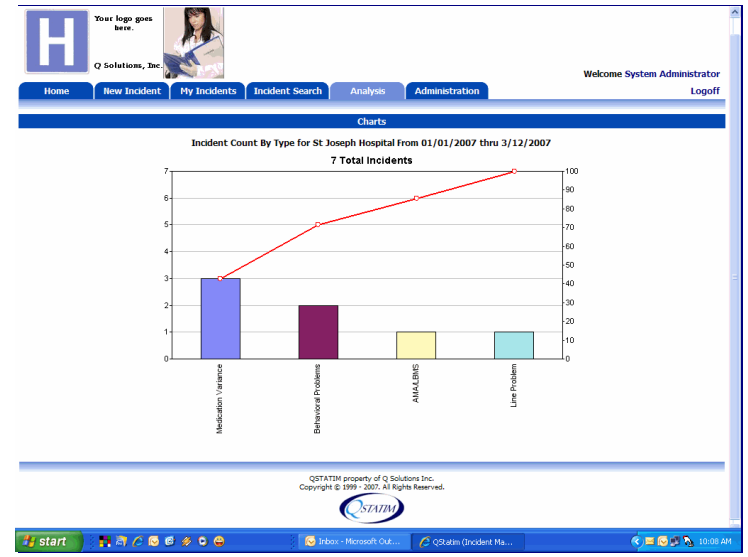

QSTATIM Incident Manager meets each of these needs.

QSTATIM Incident Manager is a browser-based software application that provides a centralized procedure for reporting, investigating, managing, and analyzing unusual incidents and sentinel events. The application has three basic components:

Entry - Management - Analysis

Entry: Staff members can access QSTATIM Incident Manager from any PC connected to the facility's intranet. The staff member is guided through only 5 intuitive screens for entering the incident. Email and/or pager notifications are immediately distributed when the incident is saved.

Management: Managers and administrators receive email and/or pager notification regarding each incident they need to be aware of. They can then logon and review the details of the incident, view follow-up comments entered by others, and enter their own follow-up comments.

Analysis: All managers, administrators, and risk management personnel can track events over time. Interactive charts and reports can be created to help identify problems, pinpoint areas of improvement, and evaluate quality improvement initiatives.

Visit www.qstatim.com to access a demonstration of QSTATIM Incident Manager. Or, call toll free 1-866-QSTATIM (778-2846) to talk or schedule a meeting with our sales staff.
